Considerations for recommendations – 2 dose HPV vaccination schedules

- This presentation addresses general approach for recommendations
- Specific wording for special situations, minimal intervals, and other issues not addressed
Current recommendations for HPV vaccination in the United States

- ACIP recommends routine vaccination at age 11 or 12 years*

- ACIP also recommends vaccination for females aged 13 through age 26 for males aged 13 through age 21 not previously vaccinated

- Vaccination recommended for immunocompromised persons (including persons HIV-infected) and for men who have sex with men through age 26

- 3-dose schedule (0, 1–2, 6 months)

- Vaccines
  - 2vHPV, 4vHPV or 9vHPV for females
  - 4vHPV or 9vHPV for males

*Vaccination series can be started at age 9 years
Draft proposed recommendations

- ACIP recommends routine HPV vaccination at age 11 or 12 years*
- A 2-dose schedule is recommended.† The second dose should be administered 6 to 12 months after the first dose.

*Vaccination series can be started at age 9 years
†A 3-dose series can be given (0, 1–2, 6 months)

Note: Blue text indicates further discussion needed with WG and ACIP
Draft proposed recommendations

- Vaccination is also recommended for females through 26 years and for males through 21 years not previously vaccinated

- For persons initiating vaccination before their 15th birthday, ACIP recommends 2 doses of HPV vaccine. The second dose should be administered **6 to 12 months** after the first dose.*

- For persons initiating the vaccination series after their 15th birthday, ACIP recommends 3 doses of HPV vaccine. The second dose should be administered 1 to 2 months after the first dose and the third dose 6 months after the first dose (0, 1–2, and 6 month schedule).

*A 3-dose series can be given (0, 1–2, 6 months)

Note: Blue text indicates further discussion needed with WG and ACIP
Draft proposed recommendations
If vaccination series started before 15th birthday

- Persons who started the HPV vaccination series with 9vHPV, 4vHPV or 2vHPV and
  - received 2 doses ≥ 6 months apart, are considered adequately vaccinated
  - received 2 doses < 6 months apart, should receive a third dose ≥ 6 months after dose 1
  - received 1 dose, should receive a second dose ≥ 6 months after dose 1
Draft proposed recommendations
If vaccination series started after 15\textsuperscript{th} birthday

- Persons who started the HPV vaccination series with 9vHPV, 4vHPV or 2vHPV and
  - received 3 doses with the third dose $\geq$ 6 months after dose 1, are considered adequately vaccinated
  - received 2 doses, should receive a third dose $\geq$ 6 months after dose 1
  - received 1 dose, should complete a 3-dose series (0, 1–2, 6 months)
Draft proposed recommendation

Special populations

- For immunocompromised patients of any age, including those with HIV infection, ACIP recommends 3 doses of HPV vaccine (0, 1–2, 6 months)
Issues for discussion

- Support for a 2-dose recommendation
- ACIP recommends “HPV vaccine” or “9vHPV”
- Recommendations for those starting series before 15th birthday
  - Specify intervals between doses (0, 6 months or 0, 12 months), range (6 to 12 months) or minimal interval (at least 6 months)?
  - If a 2-dose schedule is recommended, should there be an option for a 3-dose schedule?
